Compounds of the present invention may be prepared by those skilled in the art of organic synthesis employing conventional methods which utilize readily available reagents and starting materials.

30

The compounds A and intermediate 4-(halo-2-methoxy-phenyl)-piperidines F or 4-(halo-2-methoxy-phenyl)-1,2,5,6-tetrahydropyridines H of the present invention can be prepared by conventional methods by those skilled in the organic synthesis. For example, in Scheme I, metal-halogen exchange of an appropriately substituted aryl halide B with a base, such as butyllithium, forms a carboanion, and treatment of the resulting mixture with an N-protected-4-piperidone C affords a tertiary alcohol D. An example of the nitrogen protecting group Rx of the 4-piperidone C is benzyl, which can be removed by hydrogenation of D to afford amine G. Dehydration of G with an acid,

35

- 5 -

such as sulfuric acid can provide the desired 4-(halo-2-methoxy-phenyl)-1,2,5,6-tetrahydropyridine **H**. Dehydration of the tertiary alcohol **D**, removal of the nitrogen protecting group, R^x and hydrogenation of the double bond can afford 4-(halo-2-methoxy-phenyl)-piperidine **F**.

- 5 The des-halo intermediates 4-(2-methoxyphenyl)-piperidine **F** ($X = H$) and 1,2,3,6-tetra hydro-4-(2-methoxyphenyl)-pyridine **H** ($X = H$) are both known compounds and may be prepared by the following literature procedures:
- Van Wijngaarden Ineke et al, J. Med. Chem., (1988), 31(10), 1934-1940.
- Perregaard Jens et al., J. Med. Chem., (1995), 38(11), 1998-2008.
- 10 Modica Maria et al., J. Med. Chem., (1997), 40(4), 574-585.
- Solyom Sandor et al., Heterocycles, (1995), 41(6), 1139-1168.

Scheme I

- 6 -

Coupling of 4-(X-2-methoxy-phenyl)-piperidine **F** (X is H or halogen) or 4-(X-2-methoxy-phenyl)-1,2,5,6-tetrahydropyridine **H** (X is H or halogen) with an N-protected-N-alkyl aminoacid (**I**) in the presence of activating reagents, such as 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (DAEC), 1-hydroxybenzotriazole hydrate (HOBT), 4-methylmorpholine (NMM) forms amide **J** (Scheme II). The protecting group **R** is of the urethane type, preferably *tert*-butyloxycarbonyl which may be removed by the action of an acid. After deprotection, the amide may be reduced to an amine **M** with a reducing reagent such as lithium aluminum hydride (LAH) or diborane, and subsequently acylated to afford the urea **A**.

In these examples, all chemicals and intermediates are either commercially available or can be prepared by standard procedures found in the literature or are known to those skilled in the art of organic synthesis.

5-HT_{1A} Receptor Binding Assay

High affinity for the serotonin 5-HT_{1A} receptor was established by testing a compound's ability to displace [³H] 8-OH-DPAT binding in CHO cells stably transfected with human 5HT_{1A} receptor. Stably transfected CHO cells are grown in DMEM containing 10% heat inactivated FBS and non-essential amino acids. Cells are scraped off the plate, transferred to centrifuge tubes, and washed twice by centrifugation (2000 rpm for 10 min., 4°C) in buffer (50 mM Tris pH 7.5). The resulting pellets are aliquoted and placed at -80°C. On the day of assay, the cells are thawed on ice and resuspended in buffer. The binding assay is performed in a 96 well microtiter plate in a total volume of 250 µL. Non-specific binding is determined in the

presence of 10 mM 5-HT, final ligand concentration is 1.5 nM. Following a 30 minute incubation at room temperature, the reaction is terminated by the addition of ice cold buffer and rapid filtration through a GF/B filter presoaked for 30 minutes in 0.5% PEI. Compounds are initially tested in a single point assay to determine percent inhibition at 1, 0.1, and 0.01 mM, and K_i values are determined for the active compounds.

5-HT_{1A} Receptor Intrinsic Activity Assay

The intrinsic activity of compounds of the present invention was established by testing the claimed compounds ability to reverse the stimulation of cyclic adenosinemonophosphate (cAMP) in CHO cells stably transfected with the human 5-HT_{1A} receptor.

Stably transfected CHO cells were grown in DMEM containing 10% heat inactivated FBS and non-essential amino acids. The cells are plated at a density of 2×10^6 cells per well in a 24 well plate and incubated for 2 days in a CO₂ incubator. On the second day, the media is replaced with 0.5 mL treatment buffer (DMEM + 25 mM HEPES, 5 mM theophylline, 10 μ M pargyline) and incubated for 10 minutes at 37°C. Wells are treated with forskolin (1 μ M final concentration) followed immediately by the test compound (0.1 and 1 μ M for initial screen) and incubated for an additional 10 minutes at 37°C. The reaction is terminated by removal of the media and addition of 0.5 mL ice cold assay buffer (supplied in the RIA kit). Plates are stored at -20°C prior to assessment of cAMP formation by RIA. EC_{50} values are determined for the active test compounds. Compounds shown to have no agonist activities ($E_{max} = 0 \%$) are further analyzed for their ability to reverse agonist induced activity. In separate experiments, 6 concentrations of antagonist are preincubated for 20 minutes prior to the addition of agonist and forskolin. Cells are harvested as described above. The cAMP kit is supplied by Amersham and the RIA is performed as per kit instructions, and calculations of IC_{50} performed by GraphPad Prism.
